

Black Jack Rubric

Criteria	1 – Below	2 – Approaching	3 - Meeting	4 - Exceeding
Single Responsibility Principle	<ul style="list-style-type: none"> Classes are extremely entangled Multiple classes with duplicative behavior are present Code is highly repetitive 	<ul style="list-style-type: none"> Most objects are disentangled, however game logic still presents some entanglement No repetitive classes are present 	<ul style="list-style-type: none"> Classes are disentangled and reusable 	<ul style="list-style-type: none"> Game logic is contained within multiple specific worker methods and initiated by a coordinator method
Encapsulation	<ul style="list-style-type: none"> Class field access modifiers are left public or default Constructors are not declared public Classes are not declared public Methods are left at default access 	<ul style="list-style-type: none"> Some fields are made private, others are left default or public Private methods are accessed via 'getters and setters' 	<ul style="list-style-type: none"> All class fields are private and accessed only through 'getters and setters' Constructors, classes and methods are declared public 	<ul style="list-style-type: none"> Helper methods are kept private as they have no need to be accessed outside of the class
Object Oriented Programming	<ul style="list-style-type: none"> Code is largely procedural Existing classes do not follow Object Oriented principles Local variables and collections are assigned to objects 	<ul style="list-style-type: none"> Classes exist which adhere to the Single Responsibility principle Some procedural code exists, but is contained to bloated class methods 	<ul style="list-style-type: none"> Classes all adhere to Single Responsibility Objects are instantiated and passed to other objects for modification/use Objects are used to store and manipulate data, rather than local collections Procedural programming is absent 	<ul style="list-style-type: none"> Polymorphism is utilized to represent like objects
Java Language	<ul style="list-style-type: none"> Methods or variables are confusingly named or contain inappropriate language Iteration over arrays 	<ul style="list-style-type: none"> ArrayList is used for collections of objects within classes Method parameters are well named 	<ul style="list-style-type: none"> Methods are well named For each loop is correctly utilized when iterating over arrays and ArrayLists Default constructors are 	<ul style="list-style-type: none"> Code is well commented Method and variable names create near human readable code

	<p>excludes the use of the foreach loop, always defaulting to traditional for loops</p> <ul style="list-style-type: none"> · Method parameters are confusingly named · Overwritten default constructors are not replaced · Class names are plural 	<ul style="list-style-type: none"> · Class names are singular 	replaced when overridden	
Black Jack	<ul style="list-style-type: none"> · The program does not compile · When run the game cannot determine a winner · Individual card values and rank are not relayed to the player 	<ul style="list-style-type: none"> · The player can choose to hit or stay · If the dealer busts, the player wins · If the player busts, they lose · Ace value logic is complete · The deck of cards tracks which cards are available and is reshuffled when needed 	<ul style="list-style-type: none"> · Players can place bets, bet value is tracked, when a player runs out of money they must either buy more chips or leave the game · Black Jack game logic is fully functional, players can both win and lose according to the rules of Blackjack 	<ul style="list-style-type: none"> · Players can split hands · Multiple players can be in the same game · The number of decks used in a game can be selected
